锻造的主要特点

铸造: 将金属熔炼成符合一定要求的液体并浇进铸型里, 经过冷却、凝固、清理后得到有预定的形状和尺寸。

锻造: 主要是金属材料在高温加热下利用挤压的方法成型。由于金属的变形和再结晶使原来粗大枝晶和柱状晶粒变为晶粒较细、大小均匀的等轴再结晶组织, 使钢锭内原有的偏析、疏松、气孔、夹渣等压实和焊合, 其组织变得更加紧密, 提高了金属的塑性和力学性能和耐磨性。

The main features of forging

CASTING: Making the metal into the certain requirements of the liquid and pouring into the mold, after cooling, solidification and clean up, getting the requirements of the shape and size.

FORGING: After high temperature heating and using the method of extrusion to get the shape and size. Through this way, the organization of metal will be changed and became more closely, improving the strength and wear resistant.
